Installing htmlOKay

Downloading htmlOKay

htmlOKay can be downloaded from:
http://www.mturner.org/htmlOKay/htmlOKay.tar.gz.

It can be installed in the plugins directory using the download manager. It can also be installed directly into the plugins directory. Save it to lib/plugins and issue the following command from the command line:

```
tar -xzf htmlOKay.tar.gz
```

The end result will be the directory structure and files shown in the following section on **Directory Structure**.

Directory Structure

Directory	File(s)	Comments
htmlOKay	action.php	initializes current session
	syntax.php	enforces access levels
	style.css	some styles for the admin panel
	admin.php	script for the administration panel
	directory_scan-3.php	script for ajax calls from admin panel
	script.js	javascript for admin panel
htmlOKay/conf	default.php	internal
	metadata.php	internal
htmlOKay/conf/access		data directory for access control files
	get_inf.php	administrator's script for inspecting access control files
htmlOKay/lang		
htmlOKay/lang/en	intro.txt	internal
	settings.php	internal
	lang.php	internal

Setup and Configuration

Setup

1. In main.php, immediately below the body tag, include the following call to *trigger_event*:

```
<?php $temp=array(); trigger_event('HTMLOK_ACCESS_EVENT', $temp); ?>
```

main.php will be found in the template directory *inc/tpl/default*.

2. Make sure that the directory *plugins/htmlOKay/conf/access* is writable by DokuWiki. This should

work with the same permissions and ownership settings as the *data* directory and the *conf* directory.

3. Open the **Access Manager** from the Administration page and set up your permissions.

Configuration

There is currently one option setting in the Dokuwiki *Configuration Manager* under **HtmlOKay Plugin Settings:**

• Check off this box if you are installing a custom error button for display of HTML errors.

For details on the custom errors buttons and how to install one, see the section Show Errors Button on the *access violations* page.
